1928 Era "Special" Booklet Paper Variety Stamps

Now listed in the Scott catalogue

The following represents about ten years of effort.

#### 2020 EDITION SPECIAL FEATURE

#### 1928 Era "Special" Booklet Paper Variety Stamps Now listed in the Scott catalogue

Robert G. Rufe

THE STAMPS: There are eleven popular U.S. issues, specifically Scott Nos. 563, 564, 566, 567, 568, 569, C11, E13, QE1, QE2 and QE3, with well-documented paper varieties that are relatively unknown to the general collector. These same paper varieties, however, have long been included in most exhibits of the series in which they appear—the Fourth Bureau definitive series, the Beacon Air Mail, and U.S. Special Delivery and Special Handling issues. The newly listed stamps within these pages will carry the following numbers: 563b, 564b, 566a, 567b, 588a, 589a, CIII he I3a, OEIb, OEBA, DE3A.

INTRODUCTION: Eleven varieties of well-known U.S. stumps are added to this year's edition to recognize their production for a limited period in 1928 on "Special" Booklet Paper. This "Special" paper consisted of leftower flat sheets of paper from stocks specified, purchased and intended for booklet pane production by the Bureau of Engraving and Printing (BEP). The newly-listed varieties are readily identifiable, and many collectors have recognized these stamps and added them to their collections since first reported by Hugh M. Southgate in 1940.

After the last print run of booklet panes on the flat plate press (the Lindbergh booklet pane, Scott C10a). the BEP had significant remaining inventory of "Special" Booklet Paper. These remnant booklet paper stocks were redirected to ordinary sheet stamp production on flat plate presses. All subsequent booklet pane production was on rotary presses. The C10a booklet stamps were last at press on April 10, 1928, and the first sheet stamps to utilize "Special" Booklet Paper, the new Special Handling service stamps, first went to press on June 22, 1928.

BACKGROUND: Why the "Special" Paper? Sheet stamps were printed on paper whose normal grain orientation was vertical, meaning that other stamps were printed on moistened paper, the designs had a tendency to shrink horizontally as the paper dried. Stamp paper shrinks approximately four times more across the grain than with the grain, meaning that sheet stamps shrink more horizontally than vertically. Accordingly, for producing booklet pames, the BEP ordered "Special" Paper with the grain running horizontally, to assure greater stability in the horizontal dimension.

RATIONALE FOR LISTING: Definitive stamps which have been printed AND issued in both sheet stamp and booklet formats have traditionally carried major and minor catalog numbers, respectively. However, sheet

Figure 1. Borizontal dimension comparison of "Special" Booklet Puper (top) vs. regular orientation paper (bottom). These are the three Fourth Bureau "ordinary" stamps in vertical format, 563h, 564h and 566a.

Figure 2. The three horizontal format stamps are turned 90° for consistent comparison with images in Figure 1. In this orientation, the "Special" Booklet Paper varieties (upper blocks) are again wider than the regular paper stamps (lower blocks). In their conventional theorizontal arientation, "Special" Booklet Paper varieties of these three horizontal format stamps are very slightly acrossver than their corresponding abeat stamps.

stamps printed on "Special" Booklet Parper but NOT issued as booklets have not previously been listed. The newly listed parper varieties are recognizably different from their sheet stamp counterparts, and the identification quidelines which follow will highlight the differences.

HISTORICAL DEVELOPMENT: The BEP had gone to great lengths to improve centering of images on booklet pane stamps by specifying paper properties that would control shrinkage of central design images. Their solution was to print booklet stamps on paper with the grain orientation turned 90° to control shrinkage, improve centering, and keep booklets in registration as they were interleaved, covered, bound stapled and trimmed.

The BEP demonstrated its frugality by using remmant paper when flat press sheet supplies were no longer required for booklets as booklet production was transitioned to the rotary press. Somewhat analogous to Coil Waste issues, these eleven sheet stamps were produced from "Booklet Remnant" paper stocks as a cost and resource savings measure. Since the "Special" Booklet Paper varieties were not discovered until about ten years after their production, most of these stamps were used for routine postal purposes. Southgate did not report on the Special Handling issue at all, not realizing the entire run of these new denomination printings in 1928 was on "Special" Booklet Paper, having been completed before the dates he was given.

IDENTIFICATION: With care and a bit of practice,

identification is straightforward. Mamy collectors use inexpensive templates to overlay a known stamp on the candidate. First, one must be sure to begin with the proper stamp. In all cases these will be flat plate press, perf 11 stamps – no rotary press issues, and nothing with perf. 10½ Plate blocks are typically shown in technical presentations because they make for the simplest introduction. The differences in shrinkage across two or three stamps is usually dramatic.

Three of the eleven stamps, the Fourth Bureau Nos. 563b, 564b and 566a 'ordinaries,' are identified in the same manner that Washington-Pranklin sheet stamps are separated from booklet pane stamps, i.e., the booklet stamps are slightly wider and shorter than the sheet stamps for vertical format issues in this series as shown in Figure 1.

The Fourth Bureau horizontal format stamps, Nos. 567h, 568a and 568a, are identified similarly, but in the perpendicular orientation, i.e., these are slightly narrower and taller than their sheet stamp counterparts. Figure 2.

The remaining five special issue stamps, or "Back-of-the-Book" issues, Nos. C11b, E13a, QE1b, QE2b and QE3b, are all horizontal format stamps normally printed on paper with the grain running vertically, so that they are the easiest to identify – the vertical design shrinkage on "Special" Booklet Paper with a horizontal grain direction is minimal compared to paper in the normal orientation, but the horizontal difference in width is striking. Figure 3.

One elementary "low-tech" observation may help with identification. In a humid environment, stamps will shrink and curl across the grain, allowing confirmation of the

### Four Pages - A Major Addition!

Figure 3. Horizontal dimension comparison of "Special" Booklet Paper (C11h top; E13a hottom) vs. regular sheet stamp paper. These are just two of the five Special Service "Back-of-the-Book" stamps in horizontal format. All the 1928 Special Handling stamps, Nos. QE1b, QE2b and QE3b were printed on "Special" Booklet Paper

Figure 4. Plain water sprayed with an atomizer on to the reverse side of a used QE2b first day plate block illustrates dramatic shrinkage across the

direction of the paper argin. The horizontal argin direction of Special Handling stamps was one key in determining that all the 1928 stamps were on "Special" Booklet Paper.

CHALLENGE FACTOR: "Special" Booklet Paper stamps are scarcer than their regular paper counterparts. Southgate reported the actual production of stamps on "Special" paper from BEP printing records, and as a percentage of total stamps printed for each issue as

eported by Gary Griffith, these are: 563b (13%), 564b (14%), 566a (3%), 567b (Not Reported), 568g (12%) 569g (15%) C11b (Not Reported), E13a (5%), QE1b (100%). QE2b (100%) OE3b (100%)

Plate numbers are helpful, but not definitive, "Special" Booklet Paper printings were limited to certain known plate numbers, but all these plates were also used for normal sheet stamps. Table 1.

While identification is straightforward, care must be exercised in the evaluation of multiples for the Fourth Bureau issues, since margin gaps changed with the introduction of star plates; some issues will have both 2.5 mm, and 3.0 mm, gaps between stamps horizontally within the same sheet.

The Beacon Air Mail, No. C11b, may present the only significant challenge for study, since many plate numbers were used on "Special" Booklet Paper for both the red frame and blue vignette passes. Accordingly, many

	Table 1. "Special" Booklet Paper - Plate Numbers at Press from BEP Records				
Scott No.	Denom.	Plate Numbers and Notes			
563b	11¢	17617, 17618, 17619, 17620 - All narrow gauge margins

QE2b	15¢	19557, 19558, 19559, 19560			
QE3b	20¢	19541, 19542, 19543, 19544			

Table 1. Stamps and plate numbers which consumed the remnant inventory of "Special" Booklet Paper.

combinations of numbers are possible, and determining the scarcity or rarity of specific numbers and combination of numbers has not been attempted

For the Special Handling issues, these listings finally allow collectors to identify and properly catalog the three paper varieties for this longest-running flat plate production issue at the BEP All printings after 1928 until mid-1955 were on regular sheet stamp paper with vertical grain (Nos. QE1, QE2 & QE3); the 1955 printings were an "experimental" printing on an entirely different, lowmoisture content, "dry" paper (Nos. QE1a, QE2a & QE3a).

MARKET CONSIDERATIONS: Since these verrieties were not researched nor reported until well after their printing, no large stocks were sought nor are expected to exist. The varieties will be found randomly among these eleven issues in dealers' and collectors' holdings, and in some cases, in specialists' exhibits. As a comment regarding scarcity, the late Robert Markovits, a Special Delivery specialist, reported his exhibit copy of a, now, E13a plate block to be unique. While this Special Feature article was being written, a second No. E13a plate block was reported and authenticated. My mentor on this subject, the late Wallace B. Cleland, shared with me that he had only ever found two plate number singles of the No. E13a. In 15 years of searching. I have yet to locate a top margin plate block of either No. 567b or 569a. The 11¢ Hayes, No. 563b, seems to be the most readily found, perhaps because it is the lowest denomination of the ordinary stamps on "Special" Booklet Paper.

Traditionally, pricing for plate blocks of the Fourth Bureaus and the No. C11b Beacon Air Mail on "Special"

Booklet Paper have been double the base price of the sheet stamp, ranging up to five times for the Special Delivery No. E13a. Supply and demand will bring about changes in these initial valuing estimates as market forces prompt collectors to examine their stamps for these varieties and catalog presence stimulates interest in this

#### **Introduction:**

#### **Editorial Commentary by Jay Bigalke**

#### Editorial enhancements

Editorial enhancements in the 2020 U.S. Specialized catalog are prolific.

Special Feature articles are included in this catalog for two important editorial enhancements.

After long research and documented proof, the Scott U.S. Specialized catalog now lists the "special" booklet paper stamps of 1928. This includes varieties from No. 563b through QE3b, 11 stamps in all. These listings will appear only in the U.S. Specialized catalog.

The second Special Feature provides details about the new "on cover" listings for the Kansas-Nebraska overprint issues of 1929 (Scott 658-679).

# So... What's the big deal?

#### Scott doesn't add (many) new listings for "classic" stamps!

"Ah, Bob. You ask much of me. Without me spending days researching this question, let me just say that in fact many more listings are added each year than are deleted. Many more. In fact, I am constantly amazed how many new items are found after all these decades of collecting. Not so much in the frontof-the-book areas, but mainly in the back-of-the-book areas. Without divulging upcoming Scott secrets too much, let me just say that the 2020 Scott U.S. Specialized catalog will introduce not only the Special Booklet Papers, but also more than 40 new Essays, many more new Test Stamps, perhaps 40 new Postal Counterfeits and one Revenue Counterfeit, Christmas Seal listings complete from 1980 to the present, many new tagging varieties and errors, a new Carrier lettered minor, several new Local unlettered minors, new Revenues, new Proof lettered varieties, new lettered Canal Zone errors, and perhaps 40+ new Ryukyus overprint errors. Many more new U.S. Essays to come for 2021. Relay this to your club if you would like." Jim Kloetzel

### Rationale for Listing...

- These stamps are recognizably different from their sheet stamp (major listing) counterparts.
- They are akin to "Printer's Waste" listings; they
  utilized remnant stocks of paper sheets purchased
  for producing booklet stamps on flat plate presses.
- All early booklet stamps are accorded minor listings.

They have been recognized in Durland for many years.

### Why 1928? Where did this paper come from?

Lindbergh Sheet Stamp; Issued June, 1927.

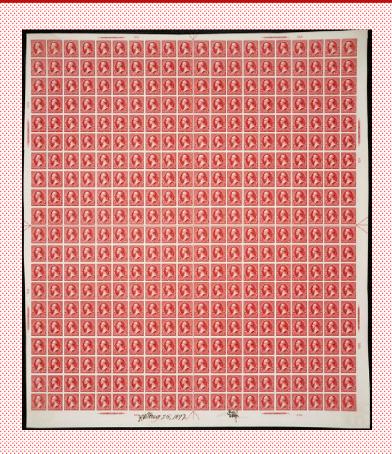

After May, 1928, Booklet stamps were printed on Rotary Presses..

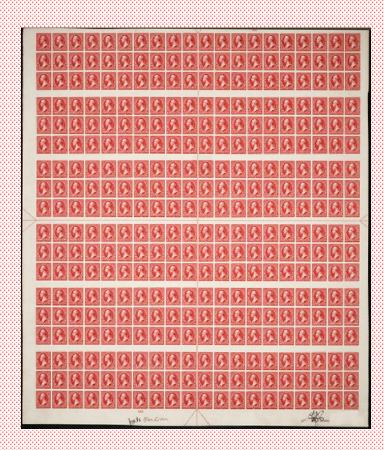

Lindbergh Booklet – C10a; Issued May, 1928: The LAST Booklet stamp printed On the flat plate press!

The BEP had excess inventory of Booklet Stamp Paper!

#### Identification...

- Key Concept: <u>Shrinkage</u> of wet-printed stamps!
- Sheet stamp paper was specified with vertical grain.
- Booklet paper was specified with horizontal grain.
- Drying paper shrinks 4 times more across the grain (than with the grain).
- Plate numbers may be used to <u>assist</u> identification.

Plate Number Singles (PNS) also listed in Hebert's.

#### Examples...

Very easily seen across three stamps as in plate blocks.

#### A closer look...

Requires collector knowledge and skill – be a Philatelist!

### Dyslexic nightmare...

Turn horizontal format stamps for consistent measurement.

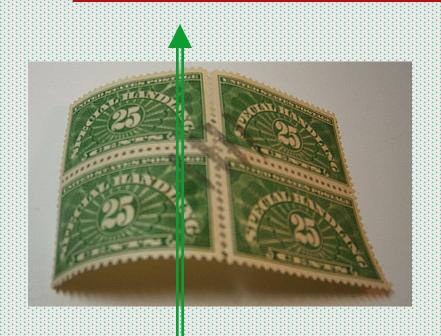

### **B-O-B** Horizontal Format Stamps are Easy...

Wider stamps amplify the impact of shrinkage.

## Tip: A Philatelic Grain Direction "Hack" Expose Paper to Elevated Humidity:

**QE4 – Known Vertical Grain** 

QE2a – Known Horizontal Grain

... or as my nephew calls it: "Shrinky Paper!"

#### Why do I call this a tribute?

NOVEMBER 2003 519

#### Size Differences Between Wet and Dry Printings from Flat Plates

By Wallace Cleland

USSS #6470, 1710 University Ave., Madison, WI 53726

The Bureau of Engraving and Printing in 1954 began printing stamps on "dry" paper containing 5-10% moisture. Previous "wet" printings were on paper containing 15-35% moisture, but the paper had the nasty habit of shrinking during drying, particularly across the grain of the paper. This is why booklet stamps from flat plate printings are slightly wider and shorter than sheet stamps; the grain of the paper was vertical for sheet stamps but horizontal for booklet stamps.

Most collectors know that both wet and dry printings were made of the Liberty Series stamps, which were printed on rotary presses, except for part of the 8¢ bi-colored issue. Separate plates were used in this case for the two types of printing. But many collectors do not know that four stamps were printed by both the wet and dry process from the same flat plates. These are the first three denominations of the Special Handling stamps (Scott #QE1-QE3) and the \$5 Postage Due stamp, Scott #J78. In these cases Scott gives the earlier wet printings minor numbers (OE1a-OE3a, J78b).

A puzzling example is shown in Figures 9 and 10. In this case the shrinkage of the block of 4 is 2% in the vertical direction and 0.4% horizontally. It appears that the grain of the paper was oriented horizontally in this case, rather than vertically. This is reminiscent of the "special paper" printings of 1928 described in the September, 2000 issue of *The Specialist*. The block of 4 in this case was purchased from the Bloomington, Indiana post office in the early 1940s, and thus has to be from a wet printing. Further, since there was not much use for such stamps in Bloomington, this stamp is almost certainly from the initial printing of QE1 from June 25 to July 24, 1928 (the stamp was not reprinted until

November, 1941). The use of the leftover booklet special paper in 1928 is recorded from late July to November. Bureau records do not indicate use of this paper to print Special Handling stamps, but it is possible that some was used in this fashion. Either that, or the normal paper was turned sideways for the

NOVEMBER 2003 525

printing. Readers should check their wet printed Special Handling stamps to see which direction the grain of the paper runs and notify the author.

Author(s): Wallace Cleland

AUGUST 2003 37:

#### E13 Special Delivery on "Special Paper"

By Wallace Cleland

USSS #6470, 1710 University Ave., Madison, W1 53726

In the September, 2000 issue, we discussed the 1928 flat plate printings of definitives on "special paper" that was left over from booklet pane production once rotary presses were used to print booklet panes. This paper had the grain running sideways, rather than vertically, as was the case for the regular paper used for flat plate printings. Since the paper shrunk more across the grain than with it after the wet printing process, booklet stamps and stamps printed on the special paper are wider and shorter than stamps printed on the regular paper.

The special paper was used for printing of 11¢, 12¢, 15¢, 20¢, 25¢, and 30¢ regular stamps, and also for the 5¢ airmail and 15¢ Special Delivery. The latter is the scarcest of the printings, with 14,000 sheets requisitioned for this printing from August 7 to 13, 1928. The plates used were 16833-6, and we estimate that 6 or 7% of the output from these plates could be on special paper. Examples have proven very clusive, however, and only plate 16836 has been seen.

As a result we were pleased to find the single shown in Figure 1. As can be seen by the comparison with the plate single of 16857, a plate not printed on special paper, the special paper stamp is wider and shorter. While this variety does not at present have catalog listing, plate blocks on special paper will be listed and priced in the next edition of the Durland. Collectors should keep their eyes open for examples, especially on the 15e Special Delivery stamp, which is so elusive. The best way to identify this variety is to carry an example on regular paper when going to shows or stamp stores and compare it to any E13s that are available in the manner shown in Figure 1.

Figure 1. Comparison of Special Delivery stamp on "special paper" with plate singles on regular paper.

DECEMBER 2003 571

#### E13 Plate Block on "Special Paper"

By Wallace Cleland

USSS #6470, 1710 University Ave., Madison, WI 53726

In the September, 2000 issue we discussed the 1928 flat plate printings on "special paper" left over from booklet production after production of booklet panes was switched to the rotary presses. The grain of the special paper was horizontal, rather than vertical, and since the paper, which was wetted during the printing process, shrunk more across the grain than with it, stamps on special paper are wider and shorter than ones on normal paper.

The scarcest of the printings on special paper is of the 15¢ Special Delivery stamp (Scott E13), and we reported in the August issue this year a single we discovered this summer. Now Bob Markovits has sent us a photocopy of a plate block of E13 on the special paper and this is shown in Figure 1 in comparison with a plate block from the same plate on normal paper. The difference in width is obvious.

This is only the second plate number example reported on special paper for E13. Plate number 16836 was the only one previously known and it was reported by Southgate in 1939 in the American Philatelic Congress Book (pp. 27-32). So now we have plate 16833. Who will be the first to find the other two plates, 16834 and 168357.

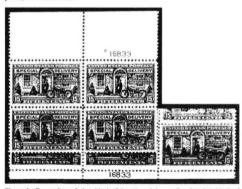

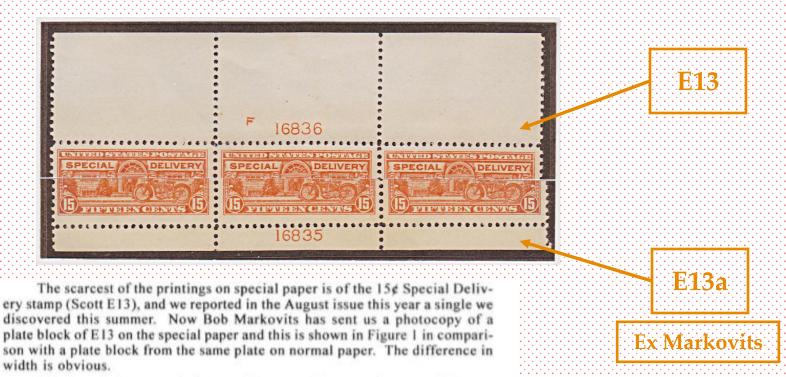

Figure 1. Comparison of plate block of 6 on "special paper" and a plate block of 4 on normal paper, both of plate 16833.

Actually goes back to Hugh Southgate's discovery in 1940.

### Here's the example in the frame:

The special paper was used for printing of 11¢, 12¢, 15¢, 20¢, 25¢, and 30¢ regular stamps, and also for the 5¢ airmail and 15¢ Special Delivery. The latter is the scarcest of the printings, with 14,000 sheets requisitioned for this printing from August 7 to 13, 1928. The plates used were 16833-6, and we estimate that 6 or 7% of the output from these plates could be on special paper. Examples have proven very elusive, however, and only plate 16836 has been seen.

for E13. Plate number 16836 was the only one previously known and it was reported by Southgate in 1939 in the *American Philatelic Congress Book* (pp. 27-32). So now we have plate 16833. Who will be the first to find the other two plates, 16834 and 16835?

This is only the second plate number example reported on special paper

#### And another new discovery:

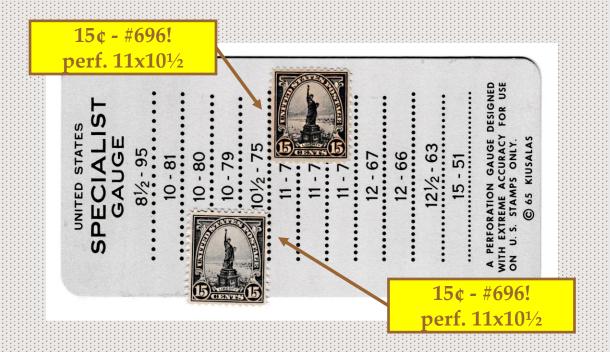

#### Here are template examples I use at shows...

Superimpose the template on top of the "patient":

#### **Caveats & Precautions!**

Just bought these at BALPEX as #566 from "trusted" dealers:

"Bush League" Mistake!! All SBP stamps are perf. 11. These two are NOT even #566 type stamps – both are Scott #696!

### Shop Online...

The candidate from eBay is perf. 11;
Use computer graphic techniques to measure on the PC:

15¢ - 566 "Patient"

30¢ Regular Paper Template

https://www.ebay.com/itm/KAPPYSstamps-17450-5COTT-566-MINT-HINGED/383185252086?\_trkparms=aid%3D1110001%26algo%3DSPLICE;SIM%26ae%3D2%26asc%3D20160323102634 %26meid%3Dc9408f042583441f90cbdc7e06922b24%26pid%3D100623%26rk/%3D3%26rkt%3D6%26sd%3D233356459043 %26itm%3D383185252086%26pmt%3D0%26noa%3D1%26pg%3D2047675&:trksid=p2047675.c100623.m-1

### Scott #566 is the most Challenging:

Statue of Liberty design frame is different from all the others.

#### **Used Stamps can be easy to ID:**

Use a simple atomizer with water;
The stamp will "curl" along the grain direction.

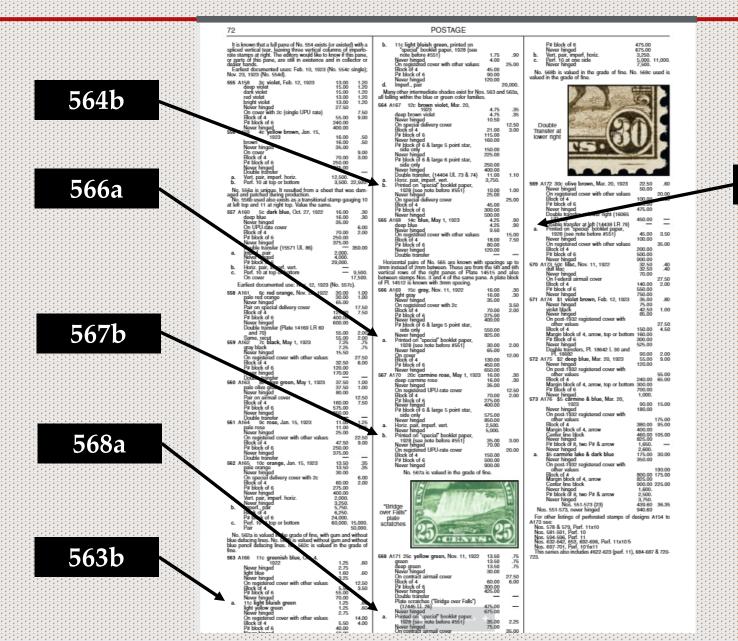

30¢ 569a Booklet Paper "Patient 1"

30¢ 569a Booklet Paper "Patient #2"

Horizontal Grain Direction (Stamp is turned in the vertical format)
